

**SPECIAL CONSIDERATIONS FOR BARIATRIC PATIENTS**

PHASE OF CARE	ISSUE	SOLUTION
PREHOSPITAL	<ul style="list-style-type: none"> <li>• Prolonged extrication</li> <li>• Difficult transfers</li> <li>• Need for specialised equipment</li> <li>• May not be able to be transported by usual means (eg: helicopter weight limitations)</li> </ul>	<ul style="list-style-type: none"> <li>• Early utilisation of other assets eg: fire for extrication assistance</li> <li>• Early request for the bariatric ambulance if available</li> </ul>
TRAUMA RECEPTION	<ul style="list-style-type: none"> <li>• Need for special equipment eg: bariatric beds, hoists</li> <li>• Risk of injury to staff with patient movement and handling</li> </ul>	<ul style="list-style-type: none"> <li>• Early prehospital notification of a bariatric patient arrival</li> <li>• Prepare necessary equipment - bariatric bed</li> <li>• encourage bariatric calls</li> <li>• Extra staff available for moving the patient</li> <li>• Special training/care with ergonomics of patient handling</li> </ul>
AIRWAY AND BREATHING	<ul style="list-style-type: none"> <li>• Predictable difficult airway</li> <li>• Increased adipose tissue around neck and face causing compression, increased airway resistance</li> <li>• Diaphragm pushed upwards with reduced vital capacity, compliance and lung volumes.</li> <li>• Rapid desaturation</li> </ul>	<ul style="list-style-type: none"> <li>• Difficult airway team call, most experienced intubator, video laryngoscopy, larger blade Mac4, bougie, back up plan -LMA / Cric</li> <li>• Two person BVM with jaw thrust</li> <li>• Keep patient sitting as upright as long as possible (if C spine clear) then ramp patient with tragus/sternal notch positioning for intubation</li> <li>• If spinal cares needed: tilt bed head up 30 deg</li> <li>• Preoxygenation, +/- PEEP, high flow apnoeic nasal prong oxygenation during intubation.</li> </ul>
	<ul style="list-style-type: none"> <li>• Increased abdominal pressure and decrease lower oesophageal tone, decreased gastrointestinal motility, GORD and aspiration common, increased airways reactivity.</li> </ul>	<ul style="list-style-type: none"> <li>• Head up, consider cricoid pressure.</li> </ul>
	<ul style="list-style-type: none"> <li>• Increased metabolic rate, baseline oxygen requirement with elevated RR and minute volume</li> </ul>	<ul style="list-style-type: none"> <li>• Maintain higher respiratory rate, PEEP, tidal volumes as per ideal weight. Consider early NIPPV.</li> </ul>
	<ul style="list-style-type: none"> <li>• Morbid obesity 10-10% have obesity hypoventilation syndrome with diminished respiratory drive in response to hypercapnia.</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor ETCO<sub>2</sub>, especially with oxygen, and opioid use.</li> </ul>
	<ul style="list-style-type: none"> <li>• Cricothyroidotomy - difficulty finding landmarks</li> </ul>	<ul style="list-style-type: none"> <li>• Mentally prepare - Assess landmarks prior to intubation, vertical incision allows flexibility with dissection.</li> </ul>
	<ul style="list-style-type: none"> <li>• Thickened chest wall</li> <li>• Breath sounds may be quieter.</li> <li>• Flail chest more difficult to appreciate</li> <li>• Plain radiography more difficult to interpret.</li> </ul>	<ul style="list-style-type: none"> <li>• Longer needle for decompression of pneumothorax, 5<sup>th</sup> ICS ant. Axillary line preferred site.</li> </ul>
CIRCULATION	<ul style="list-style-type: none"> <li>• Difficult IV access</li> </ul>	<ul style="list-style-type: none"> <li>• USS guidance, use longer IV lines, CVL, longer IO (can cutdown to place IO in extremis).</li> </ul>
	<ul style="list-style-type: none"> <li>• Supine position increases intrathoracic and intra-abdominal pressures.</li> </ul>	<ul style="list-style-type: none"> <li>• May increased blood loss when supine, ensure adequate fluids / blood</li> </ul>
	<ul style="list-style-type: none"> <li>• Larger arm results in inaccurate BP readings with standard cuff.</li> <li>• Patient may be hypertensive at baseline</li> </ul>	<ul style="list-style-type: none"> <li>• Large cuff. Consider art line monitoring if unstable.</li> <li>• Normotensive may be hypotensive for patient</li> </ul>
	<ul style="list-style-type: none"> <li>• Increased abdominal size/girth.</li> </ul>	<ul style="list-style-type: none"> <li>• Palpation of abdomen unreliable, landmarks distorted. Fast scan views may not be obtainable.</li> <li>• More reliance on CT</li> <li>• May need to transport patient to other facilities with bariatric rated scanners</li> </ul>
	<ul style="list-style-type: none"> <li>• Increased baseline metabolic demand with increased blood volume and cardiac output, longterm causing left ventr. Hypertrophy, systolic and diastolic dysfunction and cardiomyopathy</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure adequate fluids / blood but avoid overload.</li> </ul>
DISABILITY / COMORBIDITIES	<ul style="list-style-type: none"> <li>• Co-existant diabetes common, +/- insulin</li> </ul>	<ul style="list-style-type: none"> <li>• Early treatment of hypoglycaemia</li> <li>• Glove and stocking neuropathy may be normal.</li> </ul>
	<ul style="list-style-type: none"> <li>• Hypercapnia may cause decreased GCS</li> </ul>	<ul style="list-style-type: none"> <li>• ETCO<sub>2</sub> or blood gas assess</li> </ul>
EXPOSURE	<ul style="list-style-type: none"> <li>• Difficult to roll</li> </ul>	<ul style="list-style-type: none"> <li>• Recruit additional staff for log roll</li> <li>• Ensure patient on large bed</li> </ul>
	<ul style="list-style-type: none"> <li>• Difficulty with heat loss</li> </ul>	<ul style="list-style-type: none"> <li>• Active warming not usually required</li> </ul>
	<ul style="list-style-type: none"> <li>• Psychosocial component, extreme sensitivity to exposure</li> </ul>	<ul style="list-style-type: none"> <li>• Maintain dignity. Keep patient covered whenever possible</li> </ul>
SECONDARY SURVEY	<ul style="list-style-type: none"> <li>• Limitations with X-rays, poor/no FAST views, may not fit CT weight limits</li> </ul>	<ul style="list-style-type: none"> <li>• Departmental X-rays, know local CT limitations and alternatives.</li> </ul>
COMPLICATIONS	<ul style="list-style-type: none"> <li>• Pressure ulcers</li> </ul>	<ul style="list-style-type: none"> <li>• Early removal of spinal board, mattress, frequent turns</li> </ul>
	<ul style="list-style-type: none"> <li>• Hypercoagulable, increased DVTs/PEs</li> </ul>	<ul style="list-style-type: none"> <li>• TEDs, calf compression devices, enoxaparin.</li> </ul>
